

# Chapter 8

## I/O

## **I/O: Connecting to Outside World**

**So far, we've learned how to:**

- **compute with values in registers**
- **load data from memory to registers**
- **store data from registers to memory**

**But where does data in memory come from?**

**And how does data get out of the system so that humans can use it?**

# I/O: Connecting to the Outside World

## Types of I/O devices characterized by:

- **behavior:** input, output, storage
  - input: keyboard, motion detector, network interface
  - output: monitor, printer, network interface
  - storage: disk, CD-ROM
- **data rate:** how fast can data be transferred?
  - keyboard: 100 bytes/sec
  - disk: 30 MB/s
  - network: 1 Mb/s - 1 Gb/s

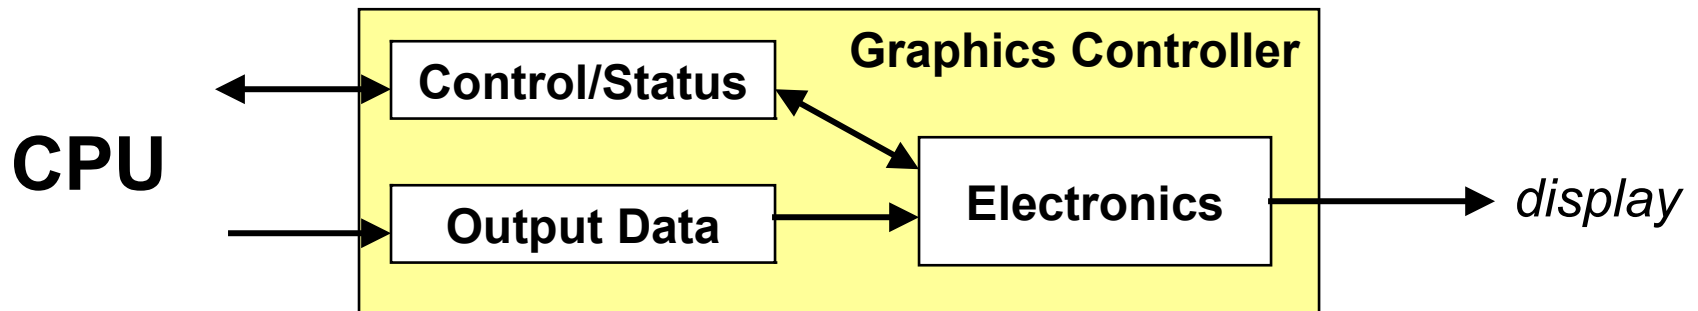

# I/O Controller

## Control/Status Registers

- CPU tells device what to do -- write to control register
- CPU checks whether task is done -- read status register

## Data Registers

- CPU transfers data to/from device

## Device electronics

- performs actual operation
  - pixels to screen, bits to/from disk, characters from keyboard

# Programming Interface

**How are device registers identified?**

- **Memory-mapped** vs. **special instructions**

**How is timing of transfer managed?**

- **Asynchronous** vs. **synchronous**

**Who controls transfer?**

- CPU (**polling**) vs. device (**interrupts**)

# Memory-Mapped vs. I/O Instructions

## Instructions

- designate opcode(s) for I/O
- register and operation encoded in instruction

## Memory-mapped

- assign a memory address to each device register
- use data movement instructions (LD/ST) for control and data transfer

## Transfer Timing

**I/O events generally happen much slower than CPU cycles.**

### Synchronous

- data supplied at a fixed, predictable rate
- CPU reads/writes every X cycles

### Asynchronous

- data rate less predictable
- CPU must synchronize with device, so that it doesn't miss data or write too quickly

# Transfer Control

Who determines when the next data transfer occurs?

## Polling

- CPU keeps checking status register until new data arrives OR device ready for next data
- “Are we there yet? Are we there yet? Are we there yet?”

## Interrupts

- Device sends a special signal to CPU when new data arrives OR device ready for next data
- CPU can be performing other tasks instead of polling device.
- “Wake me when we get there.”

## LC-3

### Memory-mapped I/O (Table A.3)

<i><b>Location</b></i>	<i><b>I/O Register</b></i>	<i><b>Function</b></i>
<b>xFE00</b>	Keyboard Status Reg (KBSR)	Bit [15] is one when keyboard has received a new character.
<b>xFE02</b>	Keyboard Data Reg (KBDR)	Bits [7:0] contain the last character typed on keyboard.
<b>xFE04</b>	Display Status Register (DSR)	Bit [15] is one when device ready to display another char on screen.
<b>xFE06</b>	Display Data Register (DDR)	Character written to bits [7:0] will be displayed on screen.

### Asynchronous devices

- synchronized through status registers

### Polling and Interrupts

- the details of interrupts will be discussed in Chapter 10

## Input from Keyboard

### When a character is typed:

- its ASCII code is placed in bits [7:0] of KBDR (bits [15:8] are always zero)
- the “ready bit” (KBSR[15]) is set to one
- keyboard is disabled -- any typed characters will be ignored

### When KBDR is read:

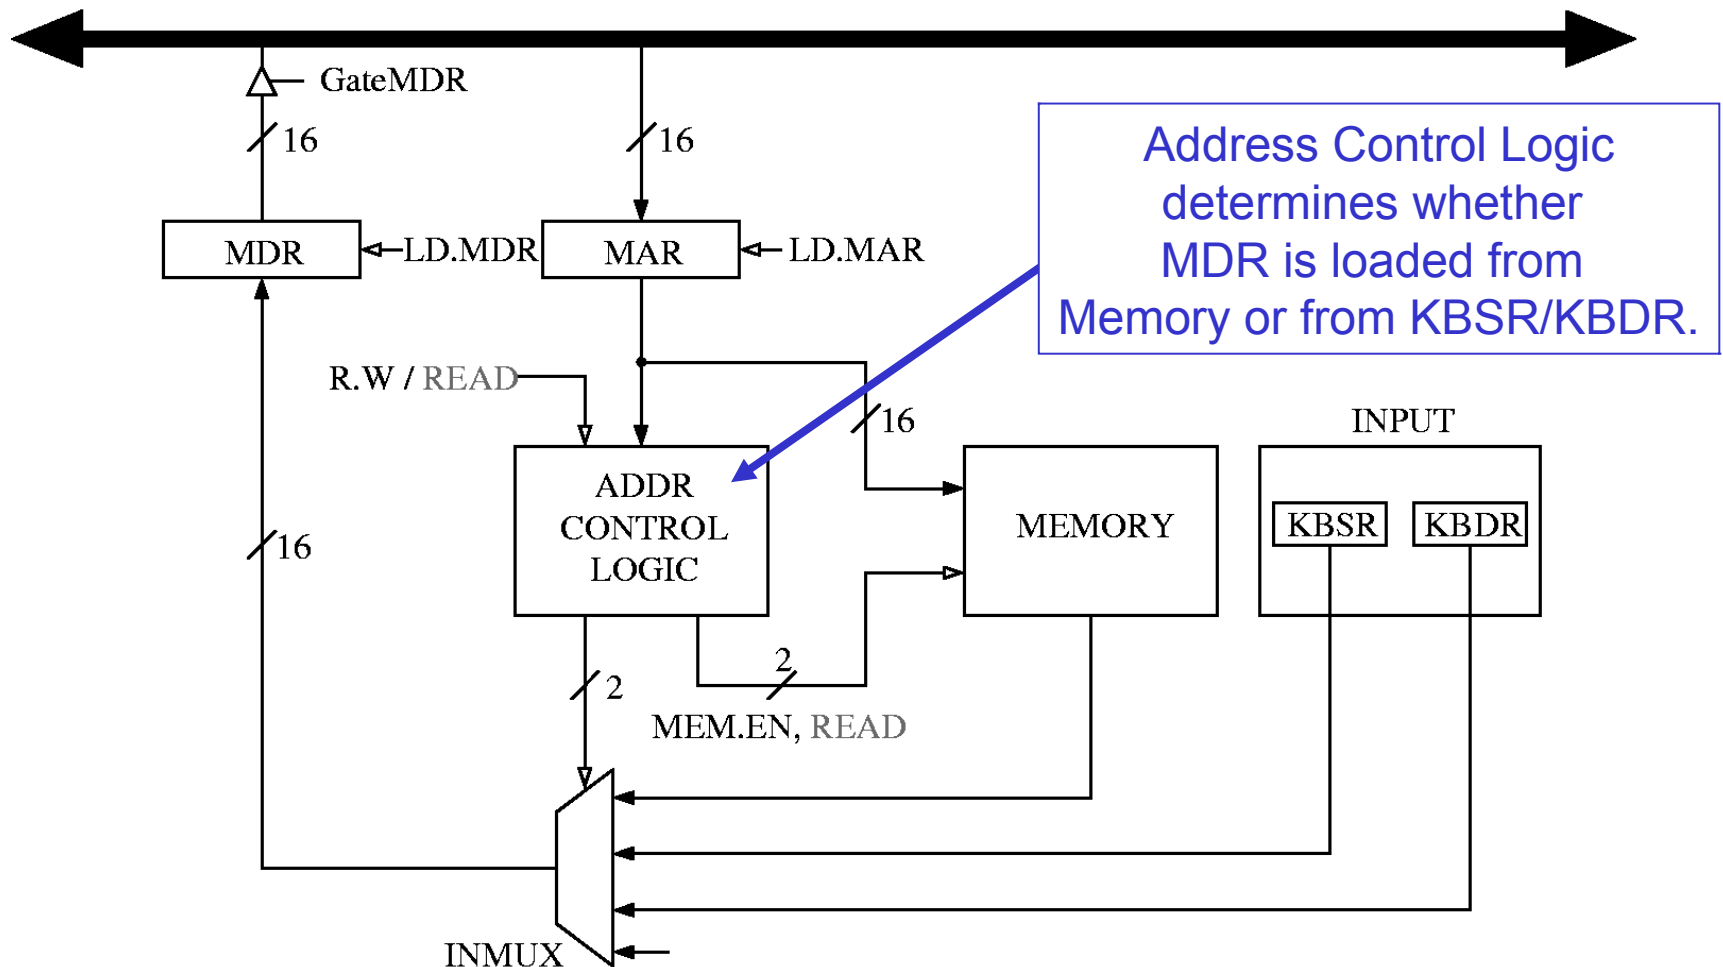

- KBSR[15] is set to zero
- keyboard is enabled

# Basic Input Routine

```
POLL      LDI    R0, KBSRPtr  
          BRzp   POLL  
          LDI    R0, KBDRPtr  
  
          . . .  
  
KBSRPtr   .FILL  xFE00  
KBDRPtr   .FILL  xFE02
```

# Simple Implementation: Memory-Mapped Input

## Output to Monitor

**When Monitor is ready to display another character:**

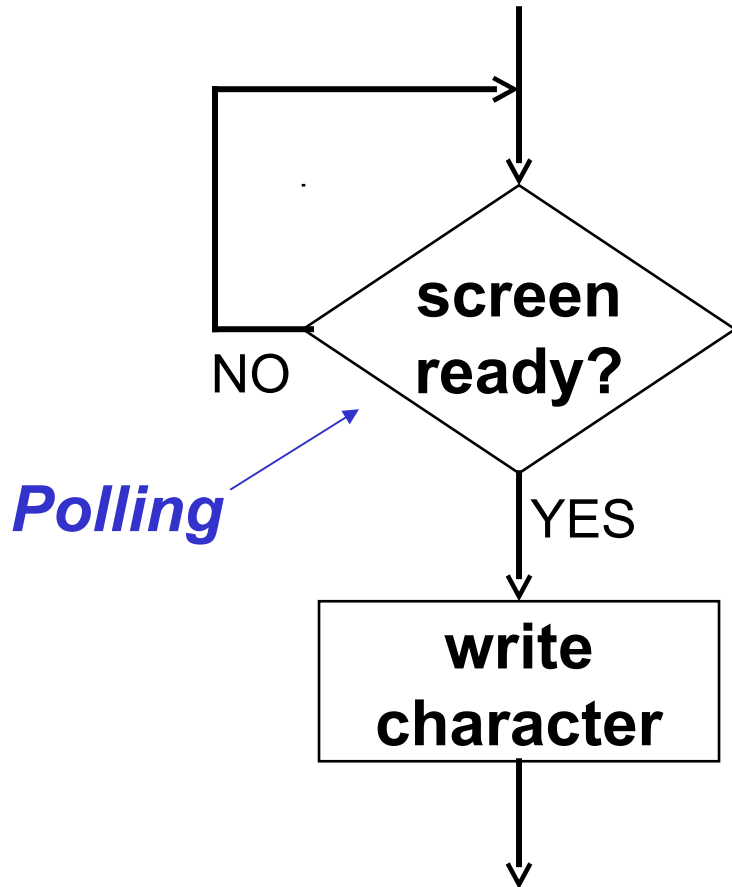

- the “ready bit” (DSR[15]) is set to one

**When data is written to Display Data Register:**

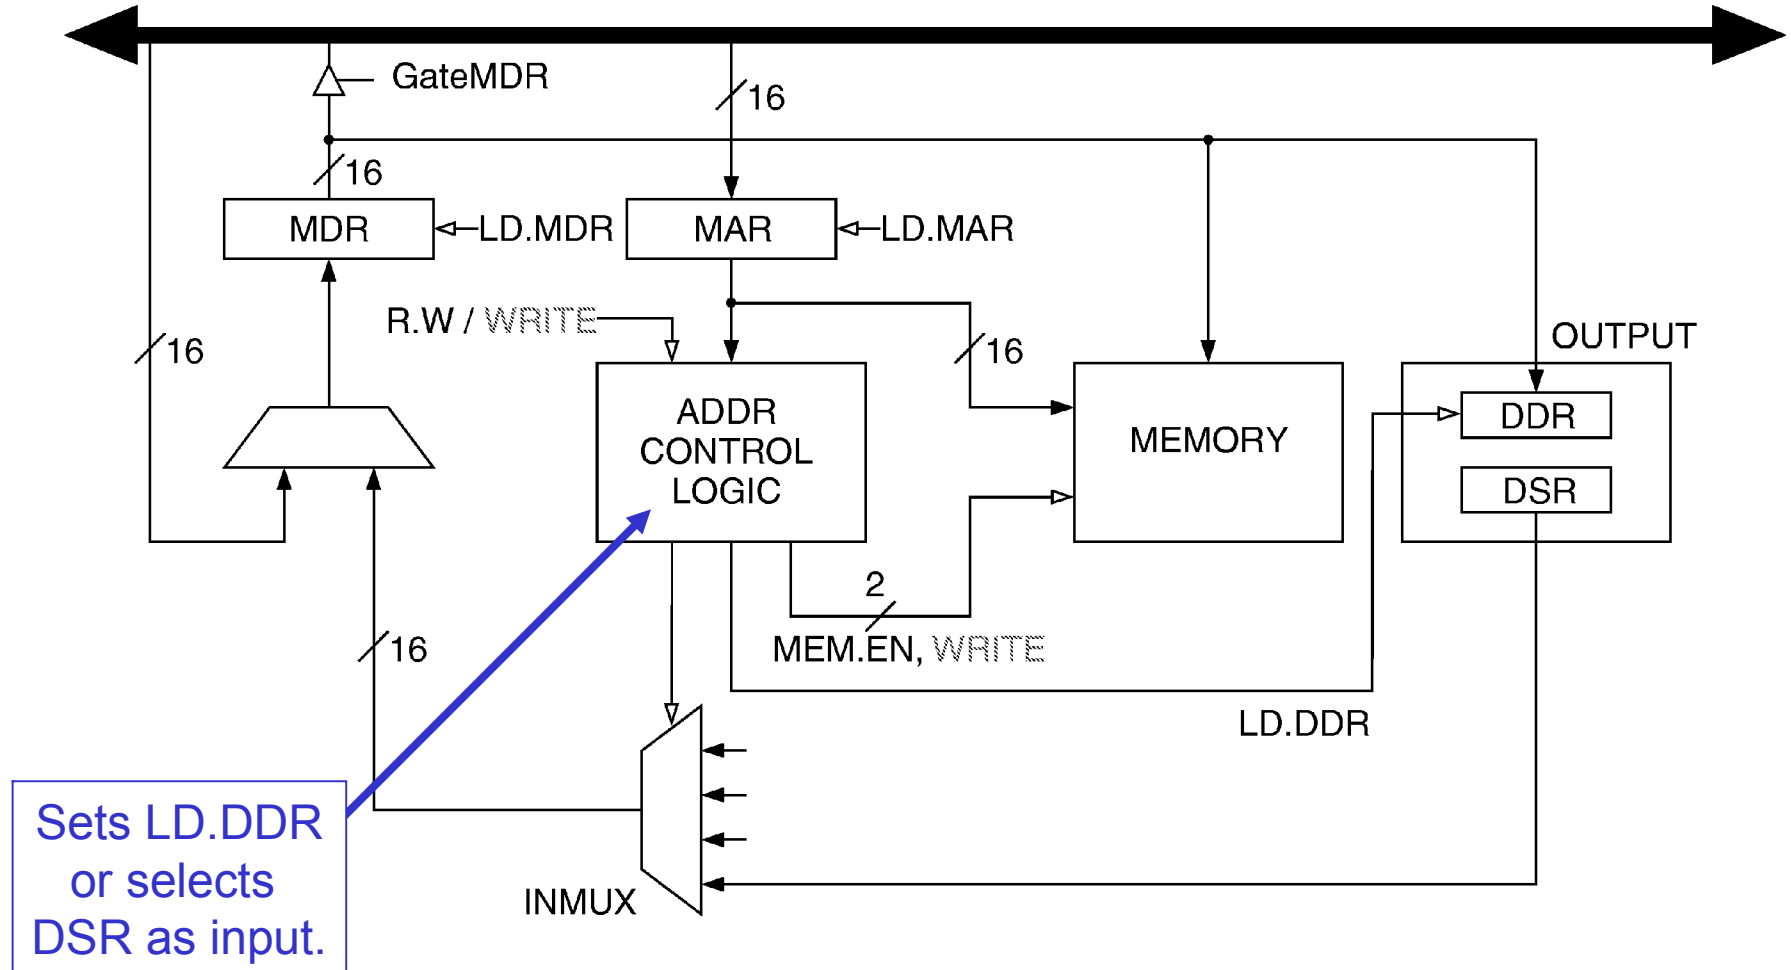

- DSR[15] is set to zero
- character in DDR[7:0] is displayed
- any other character data written to DDR is ignored (while DSR[15] is zero)

## Basic Output Routine

```
POLL    LDI    R1, DSRPtr  
        BRzp   POLL  
        STI    R0, DDRPtr  
  
        . . .  
  
DSRPtr  .FILL  xFE04  
DDRPtr  .FILL  xFE06
```

# Simple Implementation: Memory-Mapped Output

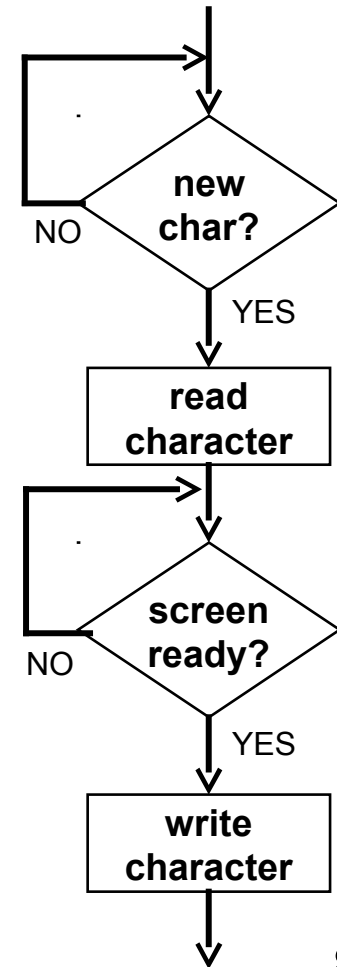

# Keyboard Echo Routine

Usually, input character is also printed to screen.

- User gets feedback on character typed and knows its ok to type the next character.

```
POLL1    LDI    R0, KBSRPtr  
          BRzp  POLL1  
          LDI    R0, KBDPtr  
POLL2    LDI    R1, DSRPtr  
          BRzp  POLL2  
          STI    R0, DDRPtr  
  
          ...  
  
KBSRPtr  .FILL  xFE00  
KBDPtr   .FILL  xFE02  
DSRPtr   .FILL  xFE04  
DDRPtr   .FILL  xFE06
```

## **Interrupt-Driven I/O**

**External device can:**

- (1) Force currently executing program to stop;**
- (2) Have the processor satisfy the device's needs; and**
- (3) Resume the stopped program as if nothing happened.**

**Why?**

- **Polling consumes a lot of cycles, especially for rare events – these cycles can be used for more computation.**
- **Example: Process previous input while collecting current input. (See Example 8.1 in text.)**

## Interrupt-Driven I/O

To implement an interrupt mechanism, we need:

- A way for the I/O device to **signal** the CPU that an interesting event has occurred.
- A way for the CPU to **test** whether the **interrupt signal is set** and whether its **priority is higher** than the current program.

### Generating Signal

- Software sets "interrupt enable" bit in device register.
- When ready bit is set and IE bit is set, interrupt is signaled.

# Priority

**Every instruction executes at a stated level of urgency.**

## LC-3: 8 priority levels (PL0-PL7)

- **Example:**
  - **Payroll program runs at PL0.**
  - **Nuclear power correction program runs at PL6.**
- **It's OK for PL6 device to interrupt PL0 program, but not the other way around.**

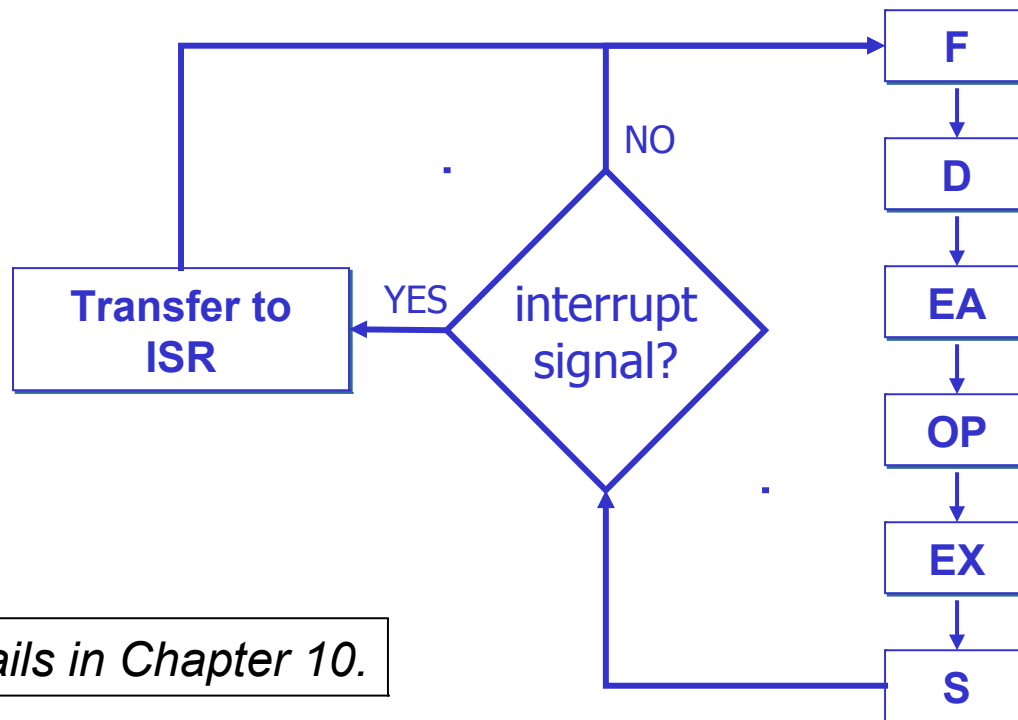

**Priority encoder** selects highest-priority device, compares to current processor priority level, and generates interrupt signal if appropriate.

## Testing for Interrupt Signal

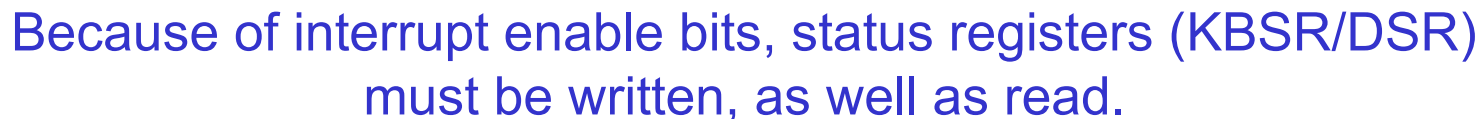

**CPU looks at signal between STORE and FETCH phases.**

**If not set, continues with next instruction.**

**If set, transfers control to interrupt service routine.**

*More details in Chapter 10.*

## **Review Questions**

**What is the danger of not testing the DSR before writing data to the screen?**

**What is the danger of not testing the KBSR before reading data from the keyboard?**

**What if the Monitor were a synchronous device, e.g., we know that it will be ready 1 microsecond after character is written.**

- **Can we avoid polling? How?**
- **What are advantages and disadvantages?**

## **Review Questions**

**Do you think polling is a good approach for other devices, such as a disk or a network interface?**

**What is the advantage of using LDI/STI for accessing device registers?**
