

Introduction to Computer Graphics

GAMES101, Lingqi Yan, UC Santa Barbara

Lecture 22: Animation (cont.)

Announcements

- Final project: extended by 1 week
- Homework 7: 175 submissions in total
 - Resubmission is welcomed
 - May decrease its weight in your final score
- Homework 8 will be released soon today
- Course certification with my signature
 - Will be sent out in electronic version after final project and resubmissions
 - Sign up for “Certification Request” (like a homework)
- Last lecture of this course :(

Today

Single particle simulation

- Explicit Euler method
- Instability and improvements

Rigid body simulation

Fluid simulation

Advertisements!

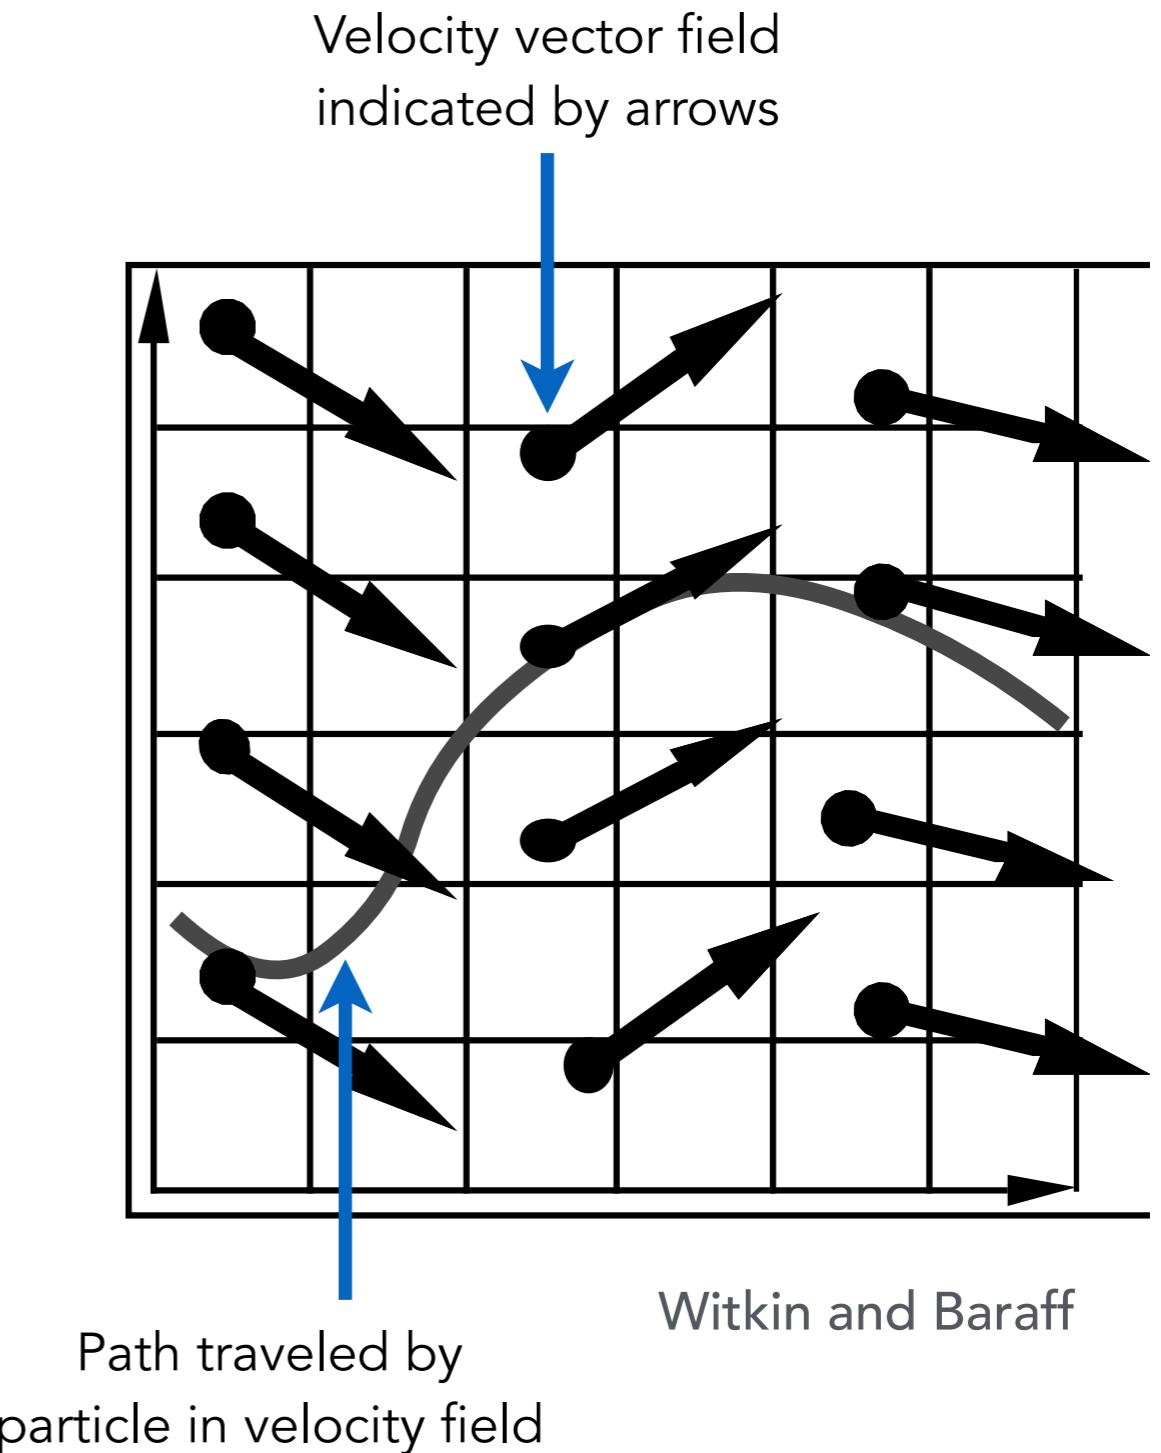

Single Particle Simulation

First study motion of a single particle

- Later, generalize to a multitude of particles

To start, assume motion of particle determined by a velocity vector field that is a function of position and time:

$$v(x, t)$$

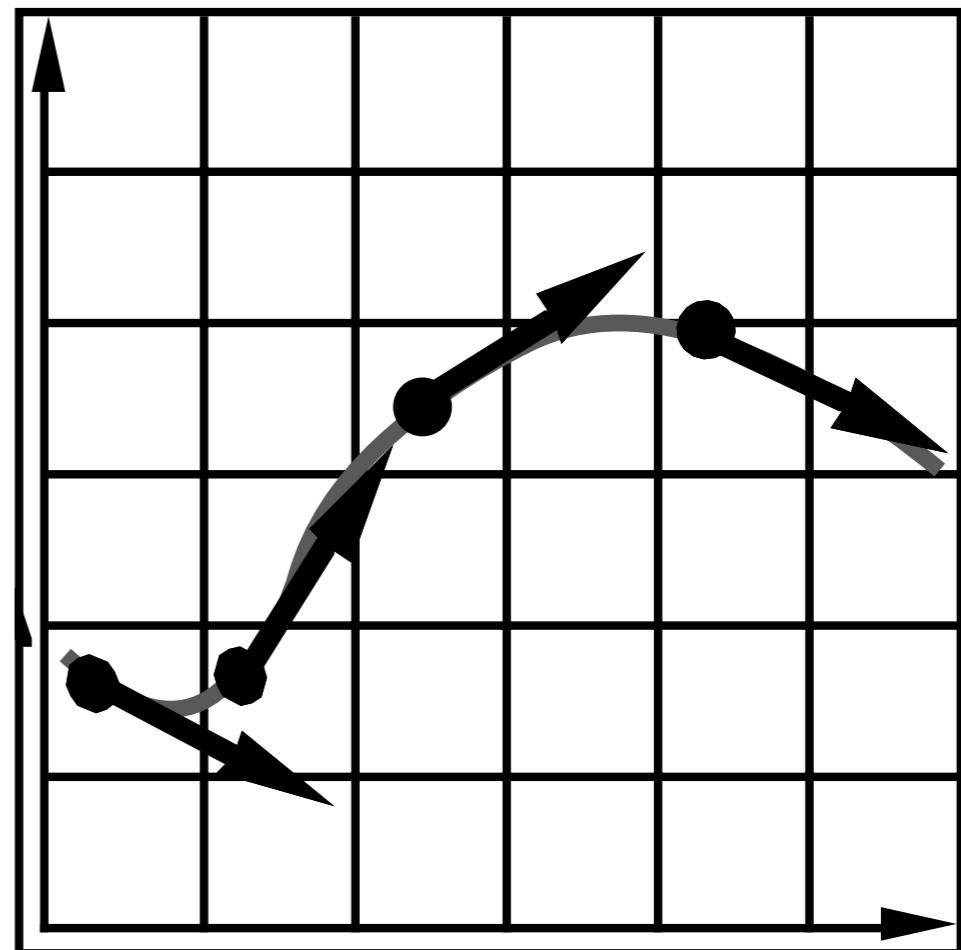

Ordinary Differential Equation (ODE)

Computing position of particle over time requires solving a first-order ordinary differential equation:

$$\frac{dx}{dt} = \dot{x} = v(x, t)$$

“First-order” refers to the first derivative being taken.

“Ordinary” means no “partial” derivatives, i.e. x is just a function of t

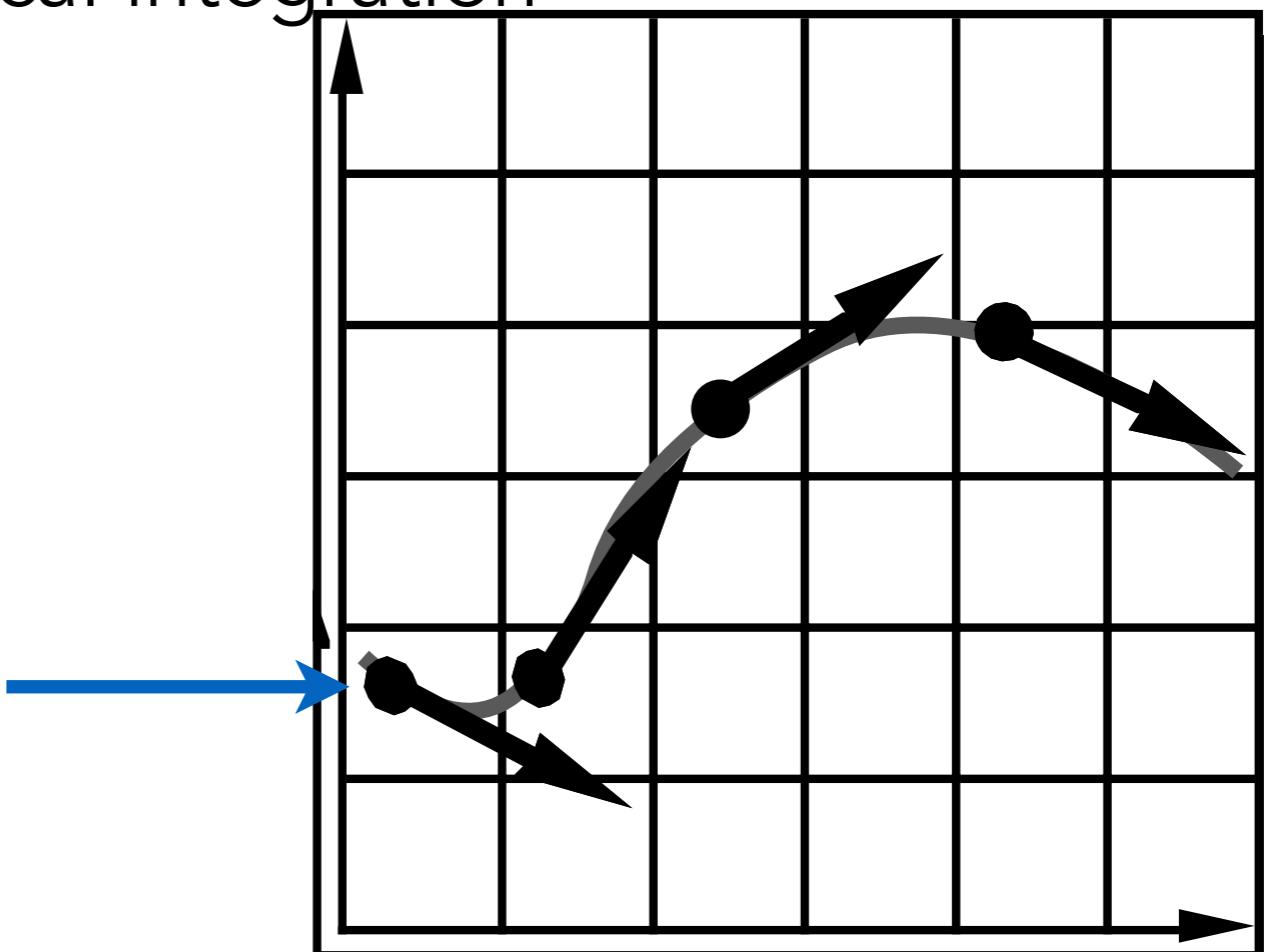

Witkin and Baraff

Solving for Particle Position

We can solve the ODE, subject to a given initial particle position x_0 , by using forward numerical integration

Starting
position x_0

Witkin and Baraff

Euler's Method

Euler's Method (a.k.a. Forward Euler, Explicit Euler)

- Simple iterative method
- Commonly used
- Very inaccurate
- Most often goes **unstable**

$$x^{t+\Delta t} = x^t + \Delta t \dot{x}^t$$

$$\dot{x}^{t+\Delta t} = \dot{x}^t + \Delta t \ddot{x}^t$$

Euler's Method - Errors

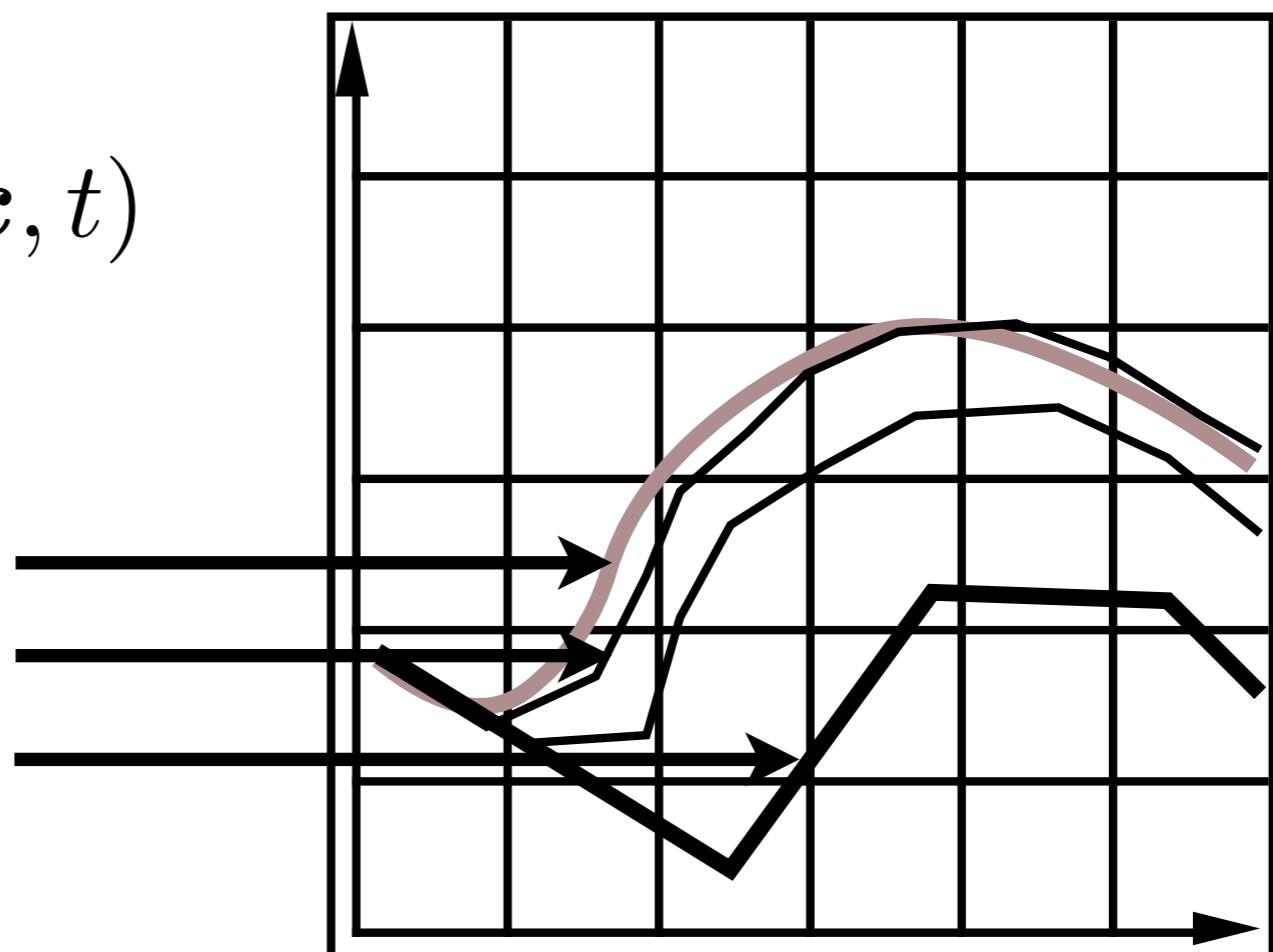

With numerical integration, errors accumulate

Euler integration is particularly bad

Example:

$$x^{t+\Delta t} = x^t + \Delta t v(x, t)$$

Solution path
Euler estimate with small time step
Euler estimate with large time step

Witkin and Baraff

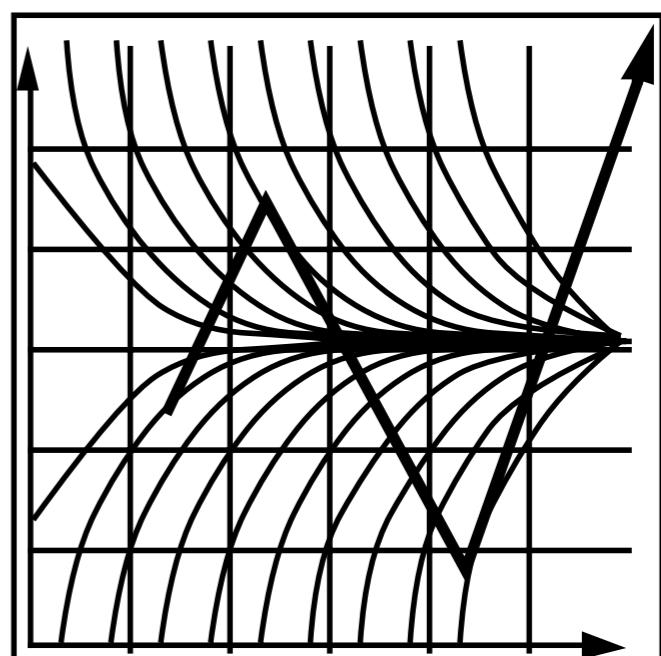

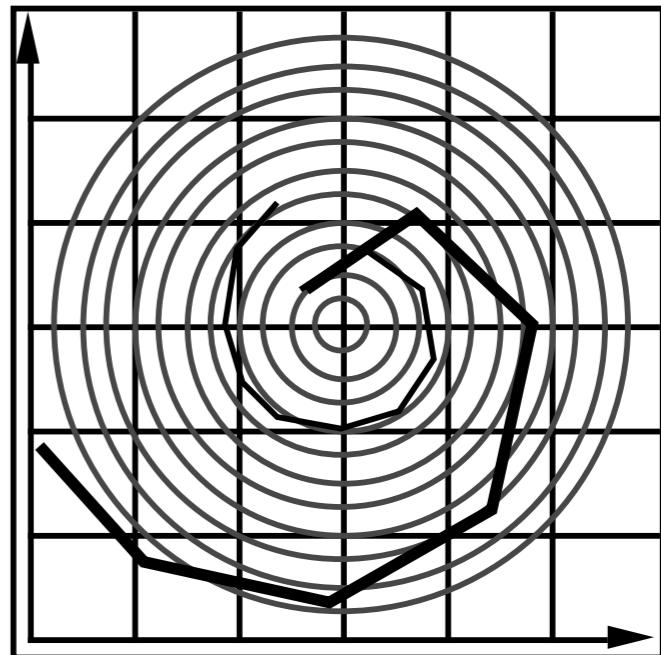

Instability of the Euler Method

The Euler method (explicit / forward)

$$\mathbf{x}^{t+\Delta t} = \mathbf{x}^t + \Delta t \mathbf{v}(\mathbf{x}, t)$$

Two key problems:

- Inaccuracies increase as time step Δt increases
- Instability is a common, serious problem that can cause simulation to diverge

Errors and Instability

Solving by numerical integration with finite differences leads to two problems:

Errors

- Errors at each time step accumulate.
Accuracy decreases as simulation proceeds
- Accuracy may not be critical in graphics applications

Instability

- Errors can compound, causing the simulation to **diverge** even when the underlying system does not
- Lack of stability is a fundamental problem in simulation, and cannot be ignored

Instability: A Disastrous Example

[PLAYERUNKNOWN'S BATTLEGROUNDS, <https://www.youtube.com/watch?v=Bz8n6GBAsys>]

Combating Instability

Some Methods to Combat Instability

Midpoint method / Modified Euler

- Average velocities at start and endpoint

Adaptive step size

- Compare one step and two half-steps, recursively, until error is acceptable

Implicit methods

- Use the velocity at the next time step (hard)

Position-based / Verlet integration

- Constrain positions and velocities of particles after time step

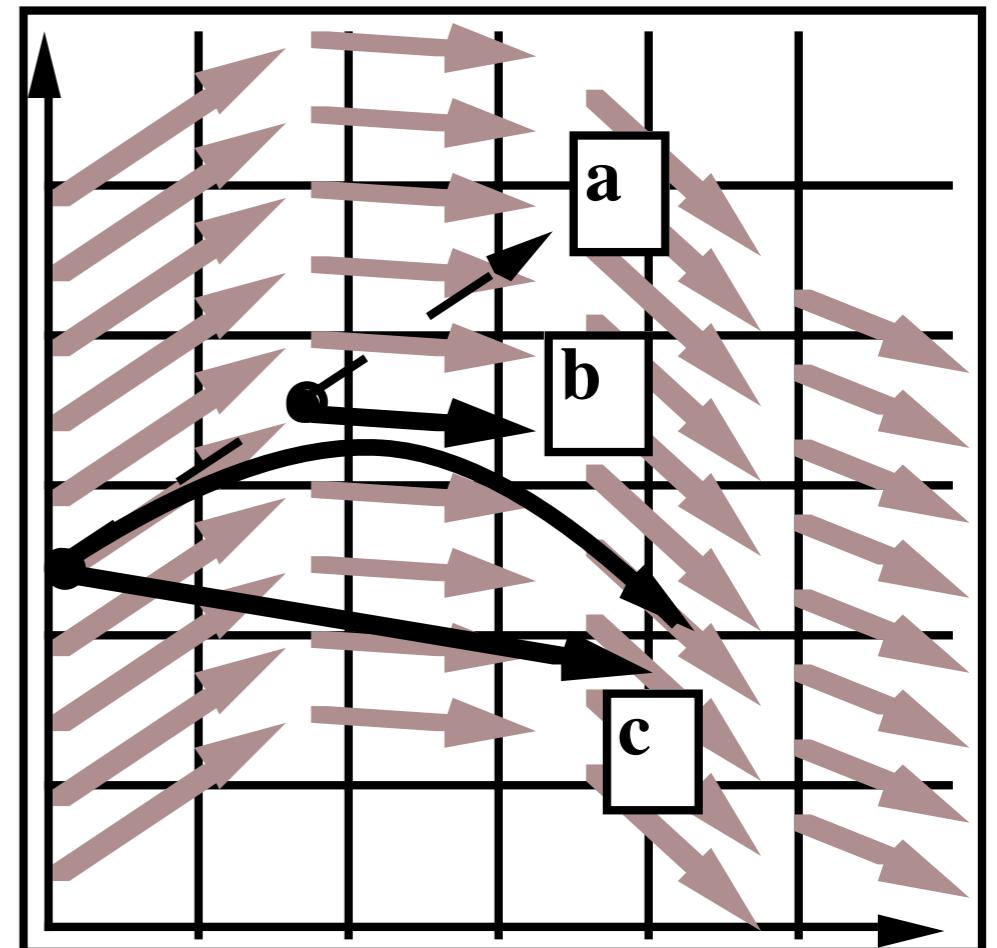

Midpoint Method

Midpoint method

- Compute Euler step (a)
- Compute derivative at midpoint of Euler step (b)
- Update position using midpoint derivative (c)

$$x_{\text{mid}} = x(t) + \Delta t / 2 \cdot v(x(t), t)$$

$$x(t + \Delta t) = x(t) + \Delta t \cdot v(x_{\text{mid}}, t)$$

Witkin and Baraff

Modified Euler

Modified Euler

- Average velocity at start and end of step
- Better results

$$\boldsymbol{x}^{t+\Delta t} = \boldsymbol{x}^t + \frac{\Delta t}{2} (\dot{\boldsymbol{x}}^t + \dot{\boldsymbol{x}}^{t+\Delta t})$$

$$\dot{\boldsymbol{x}}^{t+\Delta t} = \dot{\boldsymbol{x}}^t + \Delta t \ddot{\boldsymbol{x}}^t$$

$$\boldsymbol{x}^{t+\Delta t} = \boldsymbol{x}^t + \Delta t \dot{\boldsymbol{x}}^t + \frac{(\Delta t)^2}{2} \ddot{\boldsymbol{x}}^t$$

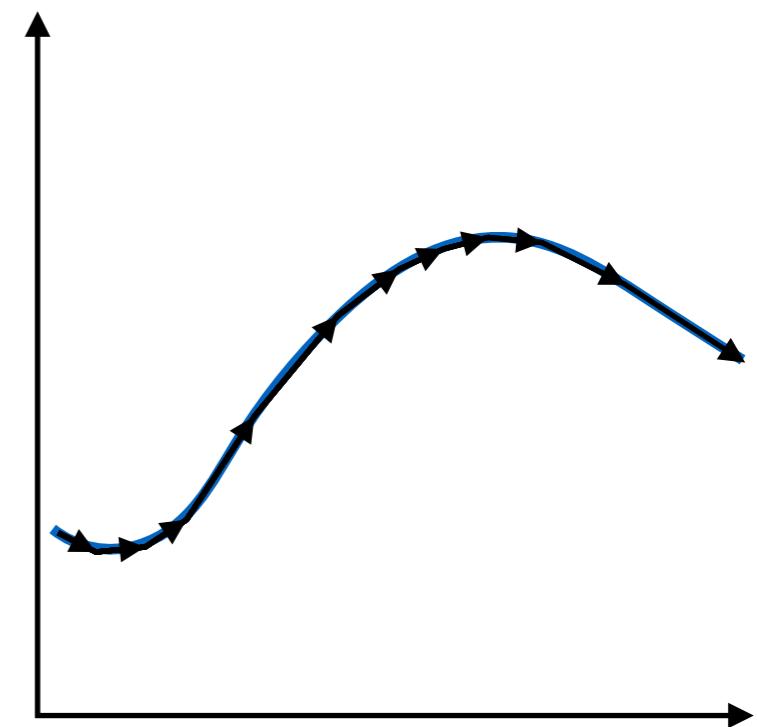

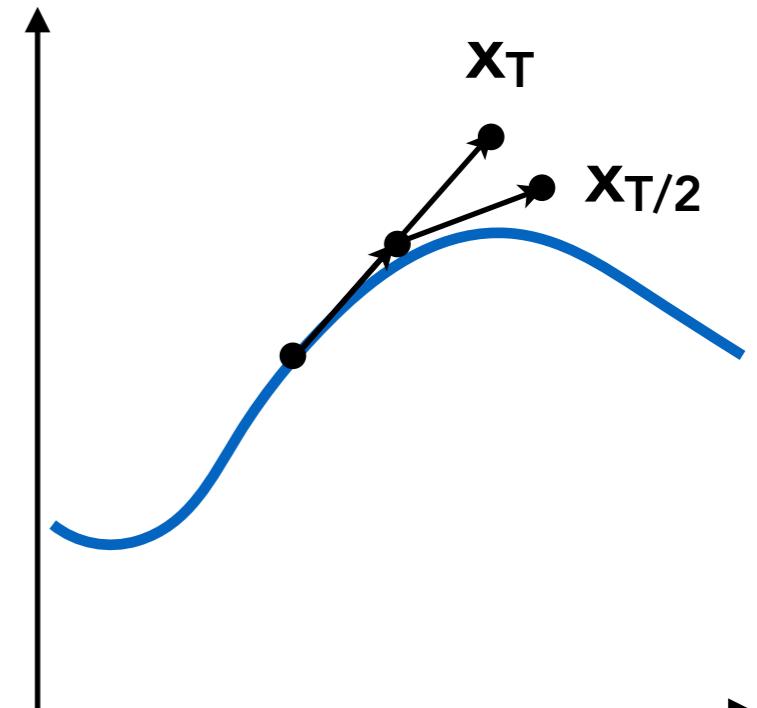

Adaptive Step Size

Adaptive step size

- Technique for choosing step size based on error estimate
- Very practical technique
- But may need very small steps!

Repeat until error is below threshold:

- Compute x_T an Euler step, size T
- Compute $x_{T/2}$ two Euler steps, size $T/2$
- Compute error $\| x_T - x_{T/2} \|$
- If (error > threshold) reduce step size and try again

Implicit Euler Method

Implicit methods

- Informally called backward methods
- Use derivatives in the future, for the current step

$$\boldsymbol{x}^{t+\Delta t} = \boldsymbol{x}^t + \Delta t \dot{\boldsymbol{x}}^{t+\Delta t}$$

$$\dot{\boldsymbol{x}}^{t+\Delta t} = \dot{\boldsymbol{x}}^t + \Delta t \ddot{\boldsymbol{x}}^{t+\Delta t}$$

Implicit Euler Method

Implicit methods

- Informally called backward methods
- Use derivatives in the future, for the current step

$$\boldsymbol{x}^{t+\Delta t} = \boldsymbol{x}^t + \Delta t \dot{\boldsymbol{x}}^{t+\Delta t}$$

$$\dot{\boldsymbol{x}}^{t+\Delta t} = \dot{\boldsymbol{x}}^t + \Delta t \ddot{\boldsymbol{x}}^{t+\Delta t}$$

- Solve nonlinear problem for $\boldsymbol{x}^{t+\Delta t}$ and $\dot{\boldsymbol{x}}^{t+\Delta t}$
- Use root-finding algorithm, e.g. Newton's method
- Offers much better stability

Implicit Euler Method

How to determine / quantize “stability”?

- We use the local truncation error (every step) / total accumulated error (overall)
- Absolute values do not matter, but the orders w.r.t. step
- Implicit Euler has order 1, which means that
 - Local truncation error: $O(h^2)$ and
 - Global truncation error: $O(h)$ (h is the step, i.e. Δt)
- Understanding of $O(h)$
 - If we halve h, we can expect the error to halve as well

Runge-Kutta Families

A family of advanced methods for solving ODEs

- Especially good at dealing with non-linearity
- Its order-four version is the most widely used, a.k.a. RK4

Initial condition:

$$\frac{dy}{dt} = f(t, y), \quad y(t_0) = y_0.$$

RK4 solution:

$$y_{n+1} = y_n + \frac{1}{6} h (k_1 + 2k_2 + 2k_3 + k_4),$$
$$t_{n+1} = t_n + h$$

where

$$k_1 = f(t_n, y_n),$$

$$k_2 = f\left(t_n + \frac{h}{2}, y_n + h \frac{k_1}{2}\right),$$

$$k_3 = f\left(t_n + \frac{h}{2}, y_n + h \frac{k_2}{2}\right),$$
$$k_4 = f(t_n + h, y_n + hk_3).$$

Position-Based / Verlet Integration

Idea:

- After modified Euler forward-step, constrain positions of particles to prevent divergent, unstable behavior
- Use constrained positions to calculate velocity
- Both of these ideas will dissipate energy, stabilize

Pros / cons

- Fast and simple
- Not physically based, dissipates energy (error)

Details in Assignment 8

Rigid Body Simulation

Simple case

- Similar to simulating a particle
- Just consider a bit more properties

$$\frac{d}{dt} \begin{pmatrix} X \\ \theta \\ \dot{X} \\ \omega \end{pmatrix} = \begin{pmatrix} \dot{X} \\ \omega \\ F/M \\ \Gamma/I \end{pmatrix}$$

X : positions

θ : rotation angle

ω : angular velocity

F : forces

Γ : torque

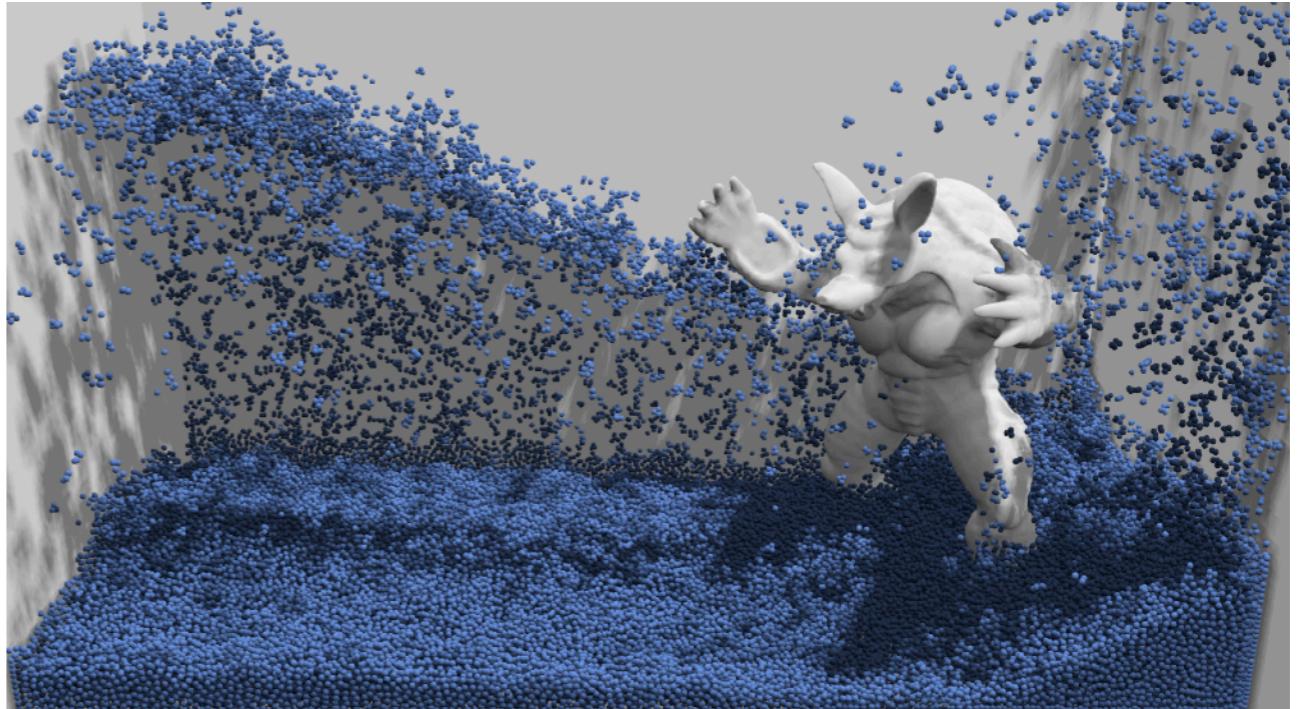

I : momentum of inertia

Fluid Simulation

A Simple Position-Based Method

Key idea

- Assuming water is composed of small rigid-body spheres
- Assuming the water cannot be compressed (i.e. const. density)
- So, as long as the density changes somewhere,
it should be “corrected” via **changing the positions of particles**
- You need to know the
gradient of the density
anywhere w.r.t. each
particle’s position
- Update? Just gradient
descent!

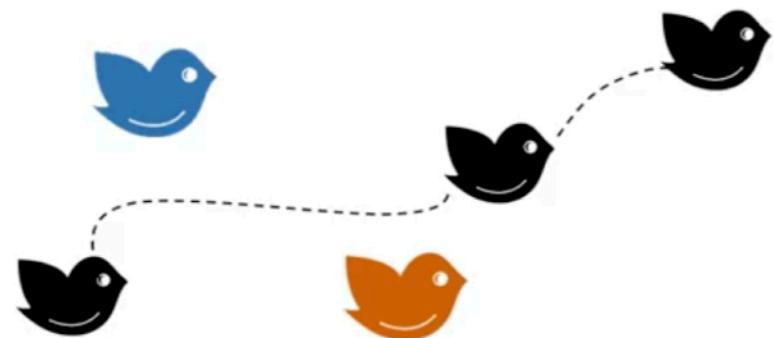

[Macklin et al.]

Eulerian vs. Lagrangian

Two different views to simulating large collections of matters

(“质点法”)

LAGRANGIAN APPROACH

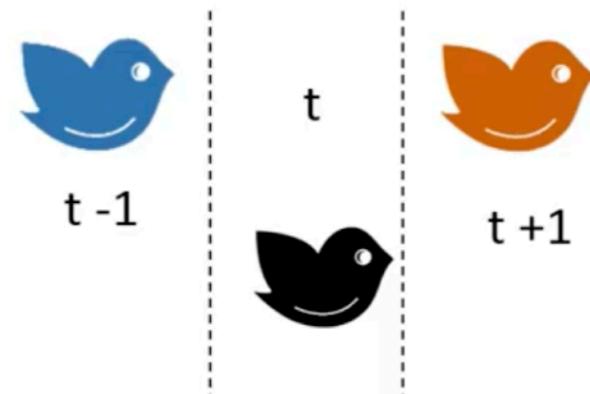

Photographer follows the same bird through out its course.

(“网格法”)

EULERIAN APPROACH

The photographer is stationary and can take picture of all the birds passing through one frame only (say at time ‘t’).

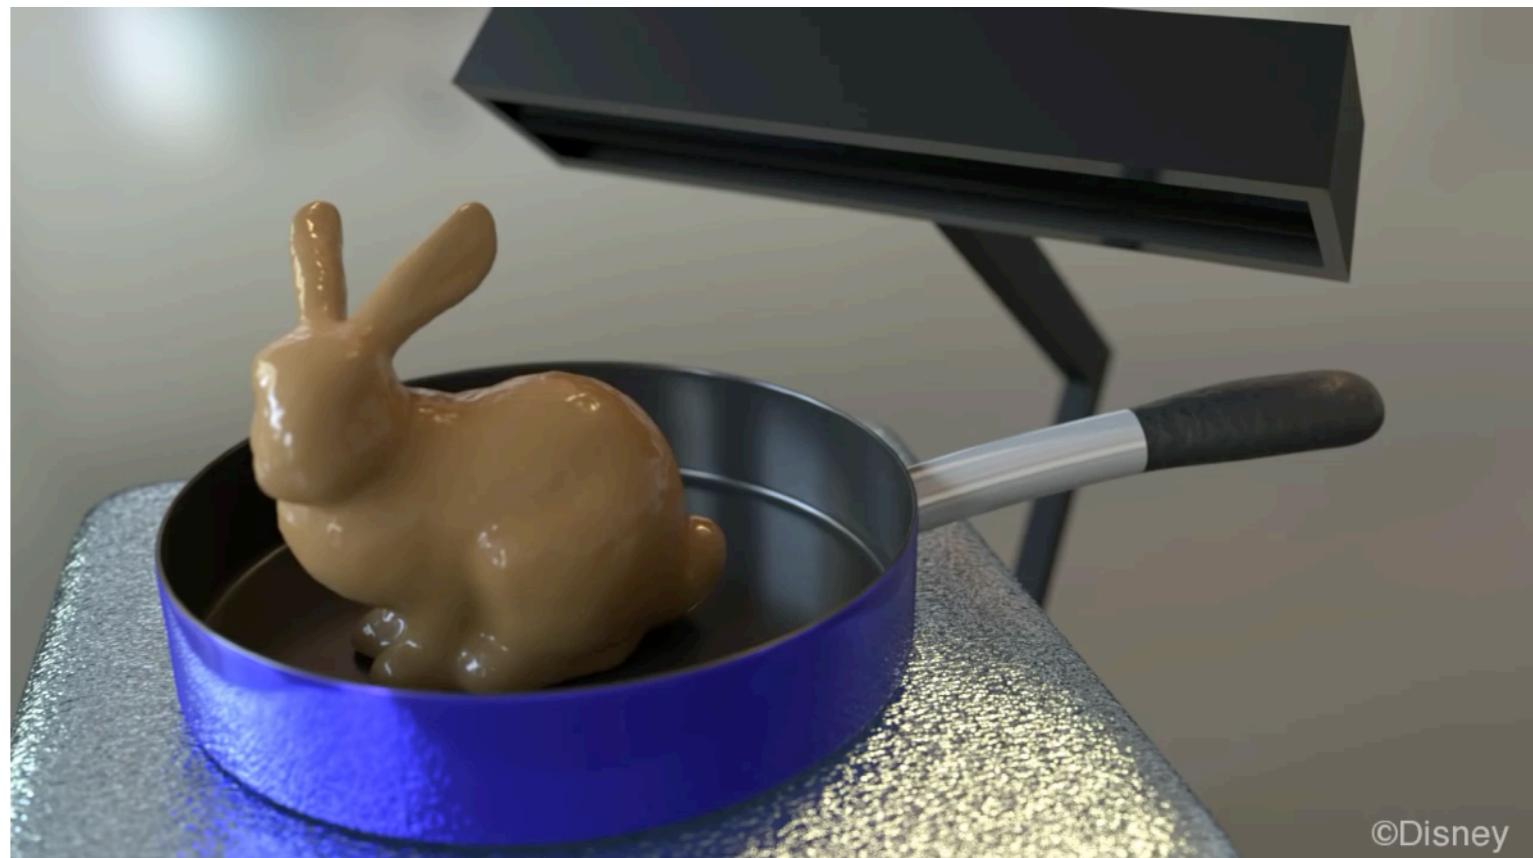

<https://www.youtube.com/watch?v=iDlzLkic1pY>

Material Point Method (MPM)

Hybrid, combining Eulerian and Lagrangian views

- Lagrangian: consider particles carrying material properties
- Eulerian: use a grid to do numerical integration
- Interaction: particles transfer properties to the grid, grid performs update, then interpolate back to particles

GAMES : 图形学在线交流平台

GAMES: Graphics AAnd Mixed Environment Symposium

- 2017年6月创建，主页：<http://games-cn.org>
- 宗旨：学术界与产业界交流与合作的平台
- 线上活动：
 - 每周四晚8:00-9:30《在线报告》
 - 2020年2月开始推出《在线课程》
 - 所有活动的视频及PPT都可在线学习和下载
- 【加入GAMES微信群方法】
 - 步骤1：在微信中加“**gamesrobot3**”为好友
 - 步骤2：回复“**GAMES**”即可获取入群邀请
 - 【前7群基本已满（每群500人），现在加第8群】

学术会议 : Chinagraph 2020 (第十三届 中国计算机图形学大会)

- 主页 : <https://chinagraph2020.xmu.edu.cn/>
- 重要日期
 - 投稿日期 : **2020年6月21日** (录用论文将推荐到期刊发表)
 - 会议日期 : 2020年10月23-25日, 厦门, 厦门大学

特邀报告
